

Van Anh Quan

FRONTEND DEVELOPER

+84 941 697 009 · qsao2212@gmail.com · Ho Chi Minh City

linkedin.com/in/wuanvan5076 · github.com/quanva2003 · quanva-portfolio.vercel.app

SUMMARY

Frontend Engineer specializing in React, React Native, and TypeScript, with production experience owning features across logistics, F&B, and multi-tenant platforms. Experienced in frontend architecture, real-time applications, state management, typed API integration, and cross-platform product delivery. Comfortable taking ownership from technical design and implementation through debugging, code review, and production support.

WORK EXPERIENCE

Dan Solutions — Frontend Developer · June 2024 – Aug 2026

Ho Chi Minh City

- Ship features across web, tablet and mobile for three live products, in teams ranging from three to seven engineers, scoping requirements directly with the PM and the client.
- Own features end to end — UI architecture, typed API integration, real-time state, and the follow-up defects — rather than picking up isolated tickets.
- Work repeatedly on the hard edge of real-time interfaces: keeping local state correct when socket payloads arrive incomplete, out of order, or while the user is mid-edit.
- Introduce and standardise shared foundations — a state layer, a generated API client, reusable components and a documented component standard — and review teammates' pull requests.
- Onboard new frontend developers and coordinate weekly delivery across concurrent projects.

GENERAL ERA DIGITAL SOLUTION JOINT STOCK COMPANY — Frontend Developer · Aug 2023 – Feb 2024

Ho Chi Minh City

- Independently built a movie web application from scratch in ReactJS — routing, API integration, form validation and UI components — delivered on schedule within the internship timeline.

AI IN MY WORKFLOW

I use Claude Code as a routine part of delivery rather than as autocomplete. On one team repository I authored the agent configuration myself — a skill-routing file mapping everyday requests to the project's planning, QA and release commands, plus the tool allowlist the agent runs under. I also wrote a resumable prompt playbook for a UI-cloning task: it browses the reference source exactly once, freezes the result into a local spec and screenshot set, and every later phase reads those files instead of re-crawling, so each phase can run in a fresh session and a dropped one costs nothing. I run agent-driven review and QA passes that produce issue reports citing file and line — the access-control defects I carried through to retest came out of one of those. The part that matters most, in my experience, is constraining the agent: giving it a written source of truth for current project state so it doesn't act on plans that have since drifted.

PROJECTS

Tamda Express — Logistics Dispatch Platform

React 19 · TypeScript · Vite · Ant Design · Zustand · TomTom Maps · Socket.IO

Order-to-shipment dispatch for a European delivery operation, live in production.

- Largest code owner on the production branch, ahead of six other engineers.
- Owned the mapping layer end to end: introduced the TomTom SDK, then built order and shipment markers, detail popups and route rendering on top of it.
- Replaced destroy-and-recreate markers with a persistent registry keyed by remote id plus visibility toggling, so switching shipment modes no longer rebuilds every marker or drops popup state.
- Implemented distributed order locking over WebSocket so two dispatchers cannot assign the same order to different shipments, surfacing who currently holds it.
- Built the OpenAPI-to-TypeScript codegen pipeline that generates the typed API client the whole team consumes, and introduced Zustand as the app's state layer.
- Kept Web-Worker search results consistent with live socket updates by patching the affected record in place and re-applying the active query instead of resetting to the full list.

Panda ERP — Multi-branch F&B Operations Platform

React Native · React 18 · TypeScript · Zustand · Socket.IO · Ant Design

Web, tablet and mobile ERP/POS for restaurant chains, tied together by a Socket.IO pipeline.

- Primary owner of the POS surface on mobile and tablet — order entry, checkout, discounts, table operations and shifts — plus the matching POS settings and table-management screens on the web client.
- Designed the first release of the Kitchen Display System: the ticket store, the socket event service, and the screen components driving real-time kitchen flow.
- Built the app's realtime layer — a socket provider plus the POS and kitchen event hooks — fanning one connection out to every screen and writing events straight into the shared store, so screens stay in sync without prop drilling.
- Fixed a state-clobbering defect where socket payloads missing kitchen status overwrote correct kitchen state, replacing whole-object swap with field-level merge.
- Refactored order-item pricing into a single utility: unified discounts to one percentage representation and separated item-level from order-level discounts so split payments compute correctly.
- Built the feedback module and cancelled-items report end to end, and standardised back-button variants across six modules into one themed component with the project's first design guideline.

Panda CMS — Multi-tenant Website Builder

Next.js 15 · React 19 · Tailwind 4 · Puck editor · NextAuth v5

Sign up, provision a site on a subdomain, edit pages visually, publish.

- Implemented subdomain multi-tenancy in Next.js middleware: host normalisation, a strict subdomain pattern that rejects malformed hosts, and rewrite into the tenant route group.
- Built the visual page editor with debounced autosave plus explicit flush on save and publish, so the last edit is never swallowed by the debounce.
- Separated draft from published content, snapshotting a version on every publish so a bad publish is recoverable.

Comzone — Comic Trading Platform · Capstone, 2024 ·

github.com/quanva2003/ComZone_MobileApp

- Built the web and mobile client for buying, selling and auctioning comics, with live bidding over Socket.IO and integrated shipping-fee and payment providers.

SKILLS

Languages & frameworks	JavaScript, TypeScript, ReactJS, React Native (Expo), Next.js
State & Data	Zustand, Redux, TanStack Query, Socket.IO, RESTful API, OpenAPI codegen
UI	Tailwind CSS, Ant Design, MUI, Shadcn UI, NativeWind
Testing & Tooling	Jest / Vitest, Git, GitHub PR review, Figma, Postman
AI workflow	Claude Code — agent configuration, skill routing, resumable prompt playbooks, agent-run QA passes

EDUCATION

FPT University HCMC — Bachelor, Software Engineering · Aug 2021 – Dec 2024 · GPA 7.1/10.0 · English: intermediate
